Theolin Chetty	ST10507916	ST10507916

Phase A – Group Establishment

Introducing the Team

Group Member 1 – Kelebogile Mmakhutjo Tema

Strengths

- Creativity – Cooking requires creativity when choosing ingredients, creating recipes, and presenting food. It also allows you to be creative when designing websites, applications, or solving technical problems.
- Problem solving – Cooking often involves figuring out how to fix a recipe when something goes wrong. In IT, you use the same mindset to troubleshoot errors, debug code, and find solutions.
- Attention to detail – Cooking requires accurate measurements, timing, and following processes. IT requires attention to detail when writing code, designing systems, and checking technical information.
- Patience – Good cooking takes time and practice, while IT often requires patience when learning new technologies or solving difficult technical problems.
- Adaptability – You can adjust a recipe when ingredients are unavailable, just as you may need to adapt when technology, software, or project requirements change.
- Time management – Cooking teaches you how to manage preparation and cooking times, while IT requires you to manage project deadlines and multiple tasks.

Areas of Interest

- Cooking and Baking
- Reading online books
- Traveling (Adventure)

Group Member 2 – Theolin Chetty

Strengths

- I built a complete visual identity, not just a colour palette. Every colour has a functional rationale (pricing, alerts, confirmation), and I finished it off with a proper logo concept.

- My reasoning for choosing the scenario is solid. I backed it up with real arguments (industry growth, audience diversity, technical complexity) instead of just going with personal preference.
- I gave the proposal genuine functional depth. The tiered discount and VAT calculation logic makes it more than just a static content site.
- I kept the document professionally structured, with a proper table of contents, consistent headings, and an appendix that maps everything back to the mark allocation.
- I translated the client's brief into concrete platform features, like the quote-not-transaction flow and the package/experience detail pages, rather than leaving requirements vague.

Areas of Interest

- Gaming and E-sports as an industry
- Booking and quotation systems with pricing and discount logic
- Colour theory and visual brand identity
- Designing for varied audience types, from casual users through to corporate clients
- High-tech, modern digital branding

Group Member 3 – Mohamed Zaeem Motala

Strengths

- Creativity – Enjoys coming up with new ideas, designs, and innovative ways of using technology.
- Problem-solving – Gaming and technology can develop the ability to analyse situations, think strategically, and find solutions.
- Determination – Studying hard shows commitment and willingness to work towards goals even when something is difficult.
- Strategic thinking – Gaming can strengthen planning, decision-making and thinking several steps ahead.
- Patience – Learning technology and overcoming difficult games requires patience and persistence.
- Curiosity – An interest in technology suggests a willingness to explore how things work and learn new skills.
- Innovation – Creativity combined with technology can help someone develop new ideas, applications and digital solutions.
- Focus and concentration – Studying and gaming both require attention and concentration to achieve good results.
- Teamwork and communication – Many games and technology projects involve working with other people and communicating effectively.

Areas of Interest

- Gaming and game development
- Graphic design and UI/UX design
- Artificial intelligence and emerging technology
- Programming and problem-solving
- Digital creativity

- Learning and academic development
- Personal growth and spirituality

Phase B – Roles and Responsibilities

Required Roles

Project Lead

Assigned To: Kelebogile Mmakhutjo Tema, Mohamed Zaeem Motala and Theolin Chetty

Responsibilities:

- Coordinate the project.
- Keep the team focused.
- Ensure deadlines are met.
- Tracks progress.

Technical Integrator

Assigned To: Kelebogile Mmakhutjo Tema, Mohamed Zaeem Motala and Theolin Chetty

Responsibilities:

- Owns repository.
- Manages merges.
- Keeps the build working.

Client Liaison

Assigned To: Kelebogile Mmakhutjo Tema, Mohamed Zaeem Motala and Theolin Chetty

Responsibilities:

- Talks to lecturer.
- Record meeting minutes.
- Record decisions made by group.
- Manages feedback.

Quality & Testing

Assigned To: Kelebogile Mmakhutjo Tema, Mohamed Zaeem Motala and Theolin Chetty

Responsibilities:

- Writes test plans.
- Checks website & mobile app.

Documentation Steward

Assigned To: Kelebogile Mmakhutjo Tema

Responsibilities:

- Keeps the project record (decisions, blockers, fixes).
- Stores UI/UX notes.
- Stores wireframes.
- Stores meeting minutes.

Additional Roles

Mobile Application Lead — Assigned To: Theolin Chetty

Website Development Lead — Assigned To: Kelebogile Mmakhutjo Tema

UI/UX Design Lead — Assigned To: Mohamed Zaeem Motala

Task Allocation Matrix

Task	Responsible Member	Supporting Members
Documentation	Kelebogile Mmakhutjo Tema	Mohamed Zaeem Motala and Theolin Chetty
Research	Mohamed Zaeem Motala and Theolin Chetty	Kelebogile Mmakhutjo Tema
Branding	Mohamed Zaeem Motala	Kelebogile Mmakhutjo Tema and Theolin Chetty

Website Development	Kelebogile Mmakhutjo Tema	Mohamed Zaeem Motala and Theolin Chetty
Presentation	All three members	All three members
Video Demonstration	All three members	All three members
Final Report	All three members	All three members

This matrix covers Task 1, Task 2 and Task 3 responsibilities, in addition to the weekly Project Lead rotation set out in the signed Team Contract (Phase C / Group Agreement below).

Phase C – Group Project Charter

Team Vision

What do we want this project to achieve?

> To design and build a professional, user-centred website and mobile application for Pawsitive Pet Academy that clearly communicates the brand's caring, trustworthy and professional identity, while giving customers an easy way to browse courses and request accurate quotations.

Team Goals

- Goal 1: Deliver a web page and mobile app with matching functionality and consistent branding by the project deadline.
- Goal 2: Apply user-centred design so the platform works for the academy's full range of customers, from individuals and families to schools and corporate clients.
- Goal 3: Maintain even distribution of workload across both members through clearly assigned roles and task ownership.

Success Criteria

How will the group know that the project has been successful?

> The project will be considered successful if both platforms are submitted on time, the fee and discount calculator works correctly, the design stays consistent with the group's finalised brand palette and fonts, and both members have contributed evenly across roles and deliverables.

Team Expectations

Expected Behaviour

- Professional Communication
- Respect for Team Members
- Timely Completion of Tasks
- Active Participation
- Attendance at Meetings
- Honest Contributions
- Positive Collaboration

Group Agreement (Team Contract) — Supporting Evidence

The group's signed Team Contract, “Meridian Tech Group,” is shown below as evidence that the Group Agreement has been completed. It was completed and signed by all three members on 5 August 2026.

TEAM CONTRACT

Team Name: Meridian Tech Group

This Team Contract represents a professional agreement between all members of the project team. By signing this document, each member agrees to contribute actively, communicate professionally, meet agreed deadlines, and uphold the standards expected within the XHAW5112 Work Integrated Learning module.

Members

Mohamed zaeem motala / / 05 Aug 2026

Team member name / Signature / Date

THEOLIN CHETTY / / 05/08/2026

Team member name / Signature / Date

By signing this contract, all members confirm that they have:

☑ Read the Team Operations Handbook
☑ Understood their responsibilities
☑ Agreed to the communication standards
☑ Agreed to the dispute-resolution process

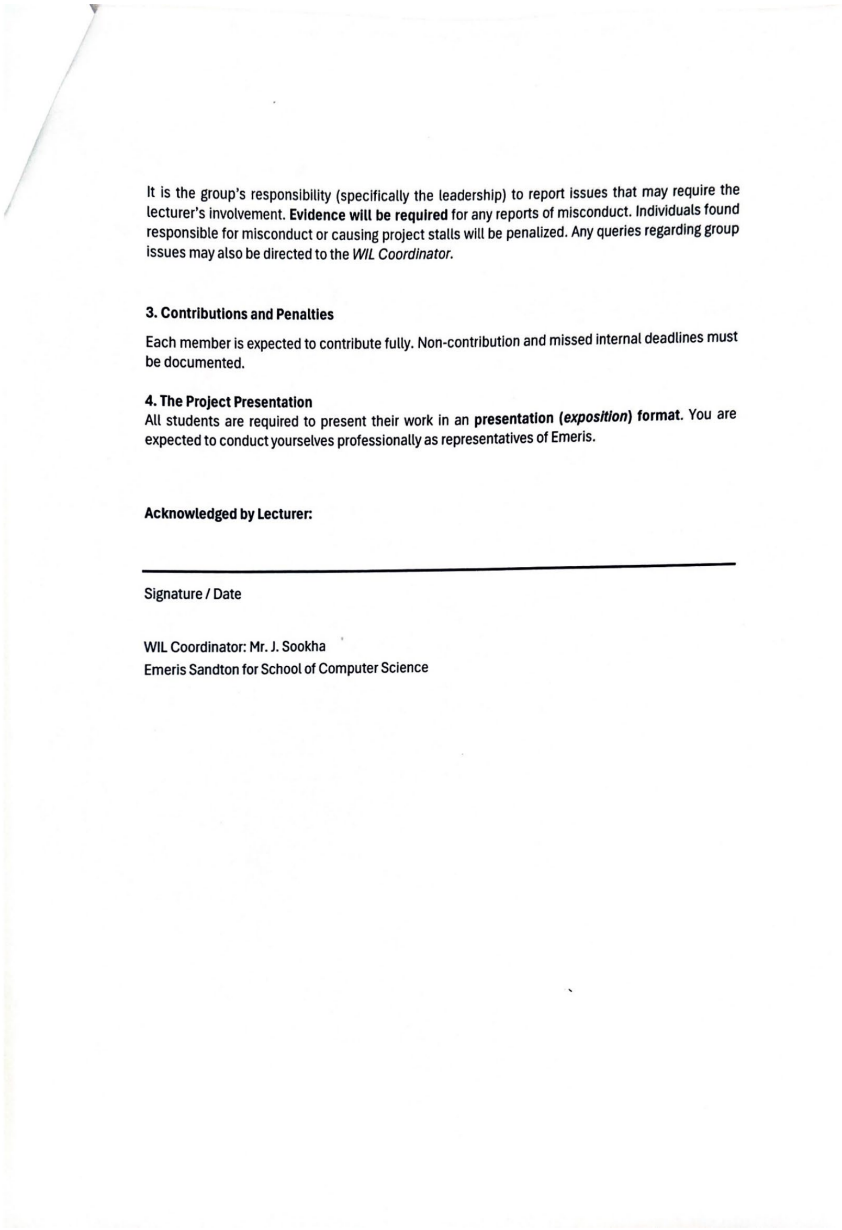

1. Group Dynamics

This group has been formed by the freewill and mutual consent of the undersigned students. The lecturer is not responsible for group pairings or internal management and acts strictly in an **advisory** capacity. *(In the event of students who do not have a group for any reason, then the lecturer will assign groups).*

2. Dispute Resolution

Should internal conflicts arise, the group is solely responsible for resolving them. The lecturer is exempt from mediating interpersonal disputes. The group must exhaust all internal resolution methods (formal meetings, mediation, etc.) and keep these on record before seeking external guidance.

Team Contract – page 2 (signatures)

It is the group's responsibility (specifically the leadership) to report issues that may require the lecturer's involvement. **Evidence will be required** for any reports of misconduct. Individuals found responsible for misconduct or causing project stalls will be penalized. Any queries regarding group issues may also be directed to the *WIL Coordinator.*

3. Contributions and Penalties

Each member is expected to contribute fully. Non-contribution and missed internal deadlines must be documented.

4. The Project Presentation

All students are required to present their work in an **presentation (*exposition*) format.** You are expected to conduct yourselves professionally as representatives of Emeris.

Acknowledged by Lecturer:

Emeris Sandton for School of Computer Science

Team Contract – page 3

Phase D – Proposal Showcase

Each group member should briefly present their Workbook 1 (Phase 1) findings.

Member 1 Proposal Summary — Kelebogile Mmakhutjo Tema

Scenario Chosen

Scenario 1: Pet Care & Training Academy, based on the business “Pawsitive Pet Academy,” owned by Sarah Smith, presented in her own report as “Paws of Love.”

Why Was It Chosen?

This scenario was chosen because it reflects a real, practical need in the community: helping pet owners learn how to properly care for and train their animals, including grooming, feeding, socialisation and emergency care. It is also commercially relevant, since the platform can increase the academy's visibility and allow bookings, enquiries and payments to be made at any time. Offering a discount for customers who book more than one course was identified as a way to encourage multi-course sign-ups.

Logo Concept Summary

The logo is a circular badge featuring a realistic poodle and a golden retriever, framed by gold detailing and soft pink hearts under the “Paws of Love” wordmark. The palette combines clean off-white tones with gold, chocolate brown and soft pink to communicate high standards, professional warmth and loving care, reassuring pet owners that their animals are in a safe, well-managed environment.

ST10510475

Course Details	Six Weeks Courses: Description	Pricing
Puppy Care	To provide new puppy owners with essential care knowledge: Feeding, Vaccinations, Toilet training, Exercise, Socialisation	R750.00
Pet First-Aid	To provide emergency first aid knowledge for pets: Minor injuries, CPR basics, Poison Awareness, Heatstroke, Emergency Transport	R750.00
Basic Dog Walking	To teach safe and professional dog walking practises: Walking Equipment Handling multiple dogs, Safety Procedures, Exercise Routines	R750.00

The Academy's Logo:
The palette combines clean off-white tones with rich gold, chocolate brown, and soft pink to instantly communicate high standards, professional warmth, and loving care. By grounding the brand in earthy, dependable shades alongside prestigious gold accents, the design reassures pet owners that their animals are in a safe, hygienic, and expertly managed environment, while the gentle pink highlights emphasize the gentle, nurturing approach of the academy.

Colour Palette Summary

Kelebogile's original individual palette (Phase 1): Beige #F5F5D0, Pure White #FFFFFF, Light Brown #B5651D, Warm Cream/Sand #F5EBE0, Light Blue #79E2D0, and Black #32322F.

ST10510475

Details Page:

This page will display all the details of the courses, pricing, durations, and how to sign up as a new user as well as store the customer's personal information on the account as well as address,, and it will show the banking details and also send out an invoice to the customer once the academy has received the payment and booking slots.

User-Centred Design:

User-Centred Design is the design that focuses on the user's needs and environment while offering users a certain experience during product development. This is the process in which UI and UX designers involve other users in certain design stages to ensure the design is both accessible and effective to use. This also plays an important role in understanding the user's behaviours and expectations rather than only knowing how the system operates. The designers have multiple teams that assist in developing the design, and they do their own research based on what they are working on. When they are about to pitch the final design, they have to test that design to see if it is user-friendly.

In the case of the proposal, it means that the developer should create simple designs that will help the customers understand what they are supposed to do and help them help reach their end goal. The design should consist of clear headings, sub-headings, and a clear body structure; icons; consistent buttons that the customers will recognise on the platforms; and simple navigation that will take them to the next pages for easier access and not create unnecessary webpages that will not be needed, as well as good colour contrasts. It is also important that the developer test the program during the development process in order to identify confusing features and improve the final product before publishing.

Member 2 Proposal Summary — Theolin Chetty

Scenario Chosen

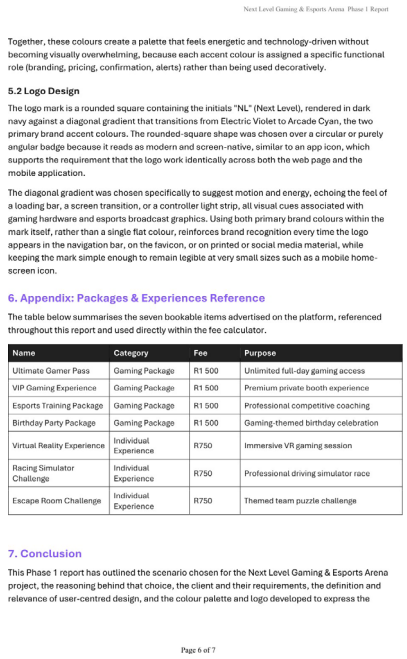

Scenario 3: Gaming & Esports Arena, based on the business "Next Level Gaming & Esports Arena," founded by Jason Naidoo.

Why Was It Chosen?

This scenario was chosen because the esports and gaming industry is one of the fastest-growing entertainment sectors, making it a realistic and commercially relevant concept to design for. The arena's seven distinct packages and experiences offered scope to demonstrate structured information architecture, while the tiered discount structure (5%, 10% and 15%) combined with VAT calculation gave the project genuine logical complexity to design and test. The scenario's diverse audience, individuals, families, schools, gaming clubs and corporate clients, also made it a strong test of user-centred design, and the modern gaming brand gave good scope for bold visual identity work.

Logo Concept Summary

The logo is a rounded-square mark containing the initials "NL" (Next Level), rendered in dark navy against a diagonal gradient that transitions from Electric Violet to Arcade Cyan. The rounded-square shape was chosen to read as modern and screen-native, similar to an app icon, so the logo works identically across both the web page and the mobile application, while the diagonal gradient suggests motion and energy in keeping with a gaming and esports brand.

Together, these colours create a palette that feels energetic and technology-driven without becoming visually overwhelming, because each accent colour is assigned a specific functional role (branding, pricing, confirmation, alerts) rather than being used decoratively.

5.2 Logo Design

The logo mark is a rounded square containing the initials "NL" (Next Level), rendered in dark navy against a diagonal gradient that transitions from Electric Violet to Arcade Cyan, the two primary brand accent colours. The rounded-square shape was chosen over a circular or purely angular badge because it reads as modern and screen-native, similar to an app icon, which supports the requirement that the logo work identically across both the web page and the mobile application.

The diagonal gradient was chosen specifically to suggest motion and energy, echoing the feel of a loading bar, a screen transition, or a controller light strip, all visual cues associated with gaming hardware and esports broadcast graphics. Using both primary brand colours within the mark itself, rather than a single flat colour, reinforces brand recognition every time the logo appears in the navigation bar, on the favicon, or on printed or social media material, while keeping the mark simple enough to remain legible at very small sizes such as a mobile home-screen icon.

6. Appendix: Packages & Experiences Reference

The table below summarises the seven bookable items advertised on the platform, referenced throughout this report and used directly within the fee calculator.

Name	Category	Fee	Purpose
Ultimate Gamer Pass	Gaming Package	R1 500	Unlimited full-day gaming access
VIP Gaming Experience	Gaming Package	R1 500	Premium private booth experience
Esports Training Package	Gaming Package	R1 500	Professional competitive coaching
Birthday Party Package	Gaming Package	R1 500	Gaming-themed birthday celebration
Virtual Reality Experience	Individual Experience	R750	Immersive VR gaming session
Racing Simulator Challenge	Individual Experience	R750	Professional driving simulator race
Escape Room Challenge	Individual Experience	R750	Themed team puzzle challenge

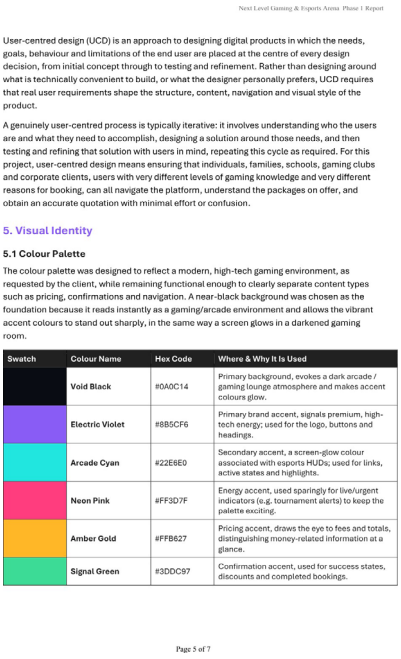

7. Conclusion

This Phase 1 report has outlined the scenario chosen for the Next Level Gaming & Esports Arena project, the reasoning behind that choice, the client and their requirements, the definition and relevance of user-centred design, and the colour palette and logo developed to express the

Figure: Theolin's original Phase 1 logo concept

Colour Palette Summary

Theolin's original individual palette (Phase 1): Void Black #0A0C14, Electric Violet #8B5CF6, Arcade Cyan #22E6E0, Neon Pink #FF3D7F, Amber Gold #FFB627, and Signal Green #3DDC97, each colour assigned a specific functional role (branding, pricing, confirmation, alerts).

Next Level Gaming & Esports Arena Phase 1 Report

User-centred design (UCD) is an approach to designing digital products in which the needs, goals, behaviour and limitations of the end user are placed at the centre of every design decision, from initial concept through to testing and refinement. Rather than designing around what is technically convenient to build, or what the designer personally prefers, UCD requires that real user requirements shape the structure, content, navigation and visual style of the product.

A genuinely user-centred process is typically iterative: it involves understanding who the users are and what they need to accomplish, designing a solution around those needs, and then testing and refining that solution with users in mind, repeating this cycle as required. For this project, user-centred design means ensuring that individuals, families, schools, gaming clubs and corporate clients, users with very different levels of gaming knowledge and very different reasons for booking, can all navigate the platform, understand the packages on offer, and obtain an accurate quotation with minimal effort or confusion.

5. Visual Identity

5.1 Colour Palette

The colour palette was designed to reflect a modern, high-tech gaming environment, as requested by the client, while remaining functional enough to clearly separate content types such as pricing, confirmations and navigation. A near-black background was chosen as the foundation because it reads instantly as a gaming/arcade environment and allows the vibrant accent colours to stand out sharply, in the same way a screen glows in a darkened gaming room.

Swatch	Colour Name	Hex Code	Where & Why It Is Used
	Void Black	#0A0C14	Primary background, evokes a dark arcade / gaming lounge atmosphere and makes accent colours glow.
	Electric Violet	#8B5CF6	Primary brand accent, signals premium, high-tech energy; used for the logo, buttons and headings.
	Arcade Cyan	#22E6E0	Secondary accent, a screen-glow colour associated with esports HUDs; used for links, active states and highlights.
	Neon Pink	#FF3D7F	Energy accent, used sparingly for live/urgent indicators (e.g. tournament alerts) to keep the palette exciting.
	Amber Gold	#FFB627	Pricing accent, draws the eye to fees and totals, distinguishing money-related information at a glance.
	Signal Green	#3DDC97	Confirmation accent, used for success states, discounts and completed bookings.

Page 5 of 7

Figure: Theolin's original Phase 1 colour palette

Member 3 Proposal Summary — Mohamed Zaeem Motala

Scenario Chosen

Scenario 1: Pet Care & Training Academy, based on the business “Pawsitive Pet Academy,” owned by Sarah Smith.

Why Was It Chosen?

This scenario was chosen because it is highly relatable, as many people own pets and can understand the day-to-day challenges of pet ownership, care and training. This makes the business idea easy to connect with from a user's perspective. In addition, the gaming and esports scenario option is a heavily saturated market with limited room for original thinking, whereas the Pet Care & Training Academy scenario offers a clear business model, a defined course structure and an interesting discount-based pricing logic to design around, giving more scope to demonstrate both marketing-style content and functional application logic.

Logo Concept Summary

The logo features a dog, as the majority of the academy's courses are dog-based. A brown tone was chosen for the dog instead of the brand's blue, to give it a more natural and realistic appearance. The dog has a smiling expression, as a friendly, cute and animated smile is more visually attractive and appealing to viewers than a neutral expression. The vine and leaf details surrounding the dog symbolise nature and growth, tying into the academy's caring, wellbeing-focused brand. The heart is shown in a light pink tone to symbolise the care that pet owners should give their animals. The sage green circular background and charcoal outline tie the logo back to the original colour palette while keeping the design simple, friendly and professional, in line with Sarah's brief.

the logo back to the chosen colour palette while keeping the design simple, friendly and professional, in line with Sarah's brief.

Figure 2: Pawsitive Pet Academy Logo (Source: Generated using Google Gemini, 2026)

Figure: Mohamed's original Phase 1 logo concept

Colour Palette Summary

Mohamed's original individual palette (Phase 1): Coral / Soft Pink #F5A3A6 (caring, warm nature), Sky Blue #89C2D1 (trust and professionalism), Sage Green #96C4B5 (wellbeing, health and nature), Charcoal #3A4A47 (body text/neutral), and Cream #FBF6EF (backgrounds/neutral).

Table 2: Discount Strategy

Number of Courses Selected	Discount
One course	No discount
Two courses	5% discount
Three courses	10% discount
More than three courses	15% discount

5.7 Account Sign-Up and Cart

Users will be able to sign up using a Google or email account. Upon signing up and paying, the user will receive a student number, allowing them to access on-site classes and locations. The cart/pricing page will show the price of the selected course(s), with payment options including card, Apple Pay, Google Pay, and EFT, with a note that EFT users should email payments@pawsitivepetacademy.com for faster processing.

It is important to note that a full booking-to-payment pipeline, including account creation, student numbers, and integrated payment gateways, goes beyond the immediate scope of this assignment. It is included here to demonstrate the complete vision for a full production version of the application; the assignment build will focus on the required enquiry and fee-calculation functionality.

6. Colour Palette

The colour palette below was chosen to reflect the caring, trustworthy and professional nature Sarah requested for her academy.

Figure 1: Pawsitive Pet Academy Colour Palette (Source: Author's own design, 2026)

Hex Code	Colour Name	Rationale
#F5A3A6	Coral / Soft Pink	Represents the caring, warm nature of the academy.
#89C2D1	Sky Blue	Represents trust and professionalism.
#96C4B5	Sage Green	Represents wellbeing, health and nature, fitting for pet care.
#3A4A47	Charcoal (Neutral)	Used for body text to ensure readability and contrast.
#FBF6EF	Cream (Neutral)	Used for backgrounds to keep the soft, caring feel while maintaining contrast.

7. Logo Design

The logo features a dog, as the majority of the academy's courses are dog-based. A brown tone was chosen for the dog instead of the brand's blue, to give it a more natural and realistic appearance. The dog has a smiling expression, as a friendly, cute and animated smile is more visually attractive and appealing to viewers than a neutral expression, helping the logo stand out and catch attention. The vine and leaf details surrounding the dog help it stand out against the background while adding colour to make the image more visually appealing, and also symbolise nature and growth, tying into the academy's caring, wellbeing-focused brand. The heart is shown in a light pink tone to symbolise the care that pet owners should give their animals, and how the academy's courses aim to make the lives of both pets and owners more enjoyable. The sage green circular background and charcoal outline tie

Selected Scenario

Pet Academy & Training

Why Was It Selected?

As a group, we chose to do Mohamed Zaeem Motala's Pawsitive Pet Academy for this project. We used AI analysis to see which idea was best suited. From the AI analysis, we saw that 2 of the 3 reports were on the Pawsitive Pet Academy topic. Theolin's proposal was declined due to his proposal being on a different topic, thus making the decision between the 2 similar Pawsitive Pet Academy proposals rather than his gaming proposal. This was the leading decision to which we were to choose. Thereafter, we chose to do Mohamed Zaeem Motala's proposal as it had more details than the other proposal, making it easier to work with.

Logo Evaluation Matrix

TOTAL	**21**	**27**	**N/A**

Final Logo Selection

Figure: Pawsitive Pet Academy – final logo, recoloured to match the group palette

Justification

We picked Mohamed Zaeem Motala's logo design and recoloured it using our new palette so it matches the website and app. When deciding between a full redesign or just a recolour, our group poll ended up in a 50-50 tie. We spun a wheel to break the tie, and it landed on doing a recolour. Everyone in the team was happy with that outcome and agreed to move forward with it. We kept the dog as the main focus since most of our academy's courses are centered around dogs. The friendly face makes the brand feel approachable, and the heart shows the caring side of what we do. The vine and leaf accents represent nature, growth, and wellbeing — which fits right in with pet care and training. Overall, it keeps things simple, clean, and professional.

Colour Palette Evaluation

Role	Palette A (Kelebogile)	Palette B (Mohamed)	Palette C (Theolin)
Primary	Beige #F5F5D0	Coral / Soft Pink #F5A3A6	Void Black #0A0C14
Secondary	Light Brown #B5651D	Sky Blue #89C2D1	Electric Violet #8B5CF6
Accent	Light Blue #79E2D0	Sage Green #96C4B5	Arcade Cyan #22E6E0

Selected Colour Palette

Owner: Kelebogile Mmakhutjo Tema

Role	Colour	Hex Code
Primary	Cream	#FFFDD0
Secondary	Powder Blue	#B0E0E6
Accent	Tan	#C68B59

Why Was It Selected?

We picked a neutral colour palette because we wanted something soft and easy on the eyes instead of using really bright or neon colours. This makes both the website and app feel much more welcoming to look at while still matching the caring, trustworthy, and professional image Sarah wants for her business. For our primary colour, we went with Cream (#FFFDD0) for the main backgrounds. It provides a soft, warm base that is way easier on the eyes than plain white, keeping the design clean and friendly. For the secondary colour, we chose Powder Blue (#B0E0E6) for background sections and display cards. The blue gives off a calm, clean vibe that helps build trust with users browsing the academy's courses. For our accent colour, we selected Tan (#C68B59) for key actions, borders, and the logo highlights. It is an earthy tone that ties into nature and pet care, and using it consistently for buttons makes it obvious where users need to click. This simple palette easily works across both the desktop website and the mobile

app. By using cream as the main background, blue to group information together, and tan strictly for interactive buttons, both platforms end up looking identical in style and are super easy for anyone to navigate.

Phase F – Final Design Decisions

Project Design Summary

Final Scenario: Pet Academy & Training

Selected Logo Owner: Mohamed Zaeem Motala

Selected Colour Palette Owner: Kelebogile Mmakhutjo Tema

Combined Elements (If Any)

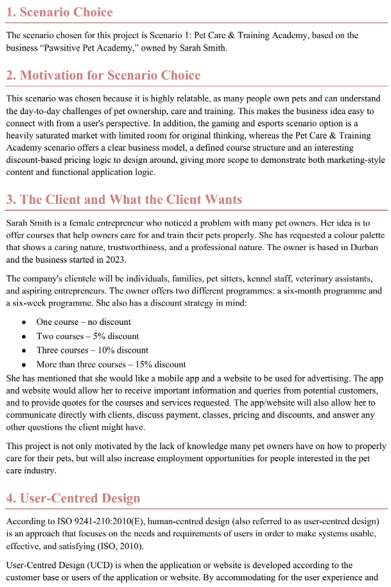

The final design combines two members' individual proposals: Mohamed Zaeem Motala's logo concept (redesigned in colour only, not reshaped) together with Kelebogile Mmakhutjo Tema's colour palette (Cream, Powder Blue, Tan). The choice between a full logo redesign or a simple recolour was itself a combined/tie-broken decision — the group poll on this was a 50-50 tie, resolved by a wheel-spin that landed on recolouring rather than a full redesign.

- ☒ Colour Palette Comparisons
- ☒ Combined Concepts
- ☒ Final Selected Designs

The screenshots below are taken from each group member's individual Phase 1 submission, showing the scenario, colour palette, and logo choices that were compared before the group reached its final decision.

1. Scenario Choice

The scenario chosen for this project is Scenario 1: Pet Care & Training Academy, based on the business "Pawsitive Pet Academy," owned by Sarah Smith.

2. Motivation for Scenario Choice

This scenario was chosen because it is highly relatable, as many people own pets and can understand the day-to-day challenges of pet ownership, care and training. This makes the business idea easy to connect with from a user's perspective. In addition, the gaming and esports scenario option is a heavily saturated market with limited room for original thinking, whereas the Pet Care & Training Academy scenario offers a clear business model, a defined course structure and an interesting discount-based pricing logic to design around, giving more scope to demonstrate both marketing-style content and functional application logic.

3. The Client and What the Client Wants

Sarah Smith is a female entreprencur who noticed a problem with many pet owners. Her idea is to offer courses that help owners care for and train their pets properly. She has requested a colour palette that shows a caring nature, trustworthiness, and a professional nature. The owner is based in Durban and the business started in 2023.

The company's clientele will be individuals, families, pet sitters, kennel staff, veterinary assistants, and aspiring entreprencurs. The owner offers two different programmes: a six-month programme and a six-week programme. She also has a discount strategy in mind:

- One course – no discount
- Two courses – 5% discount
- Three courses – 10% discount
- More than three courses – 15% discount

She has mentioned that she would like a mobile app and a website to be used for advertising. The app and website would allow her to receive important information and queries from potential customers, and to provide quotes for the courses and services requested. The app/website will also allow her to communicate directly with clients, discuss payment, classes, pricing and discounts, and answer any other questions the client might have.

This project is not only motivated by the lack of knowledge many pet owners have on how to properly care for their pets, but will also increase employment opportunities for people interested in the pet care industry.

4. User-Centred Design

According to ISO 9241-210:2010(E), human-centred design (also referred to as user-centred design) is an approach that focuses on the needs and requirements of users in order to make systems usable, effective, and satisfying (ISO, 2010).

User-Centred Design (UCD) is when the application or website is developed according to the customer base or users of the application or website. By accommodating for the user experience and

Figure: Screenshot from Mohamed's Phase 1 submission – Scenario Selection

> Accepted in full. Mohamed's scenario, Pawsitive Pet Academy, became the group's final scenario. It was more developed than the competing Pet Academy proposal, with a full page-by-page breakdown and stronger grounding in user-centred design research.

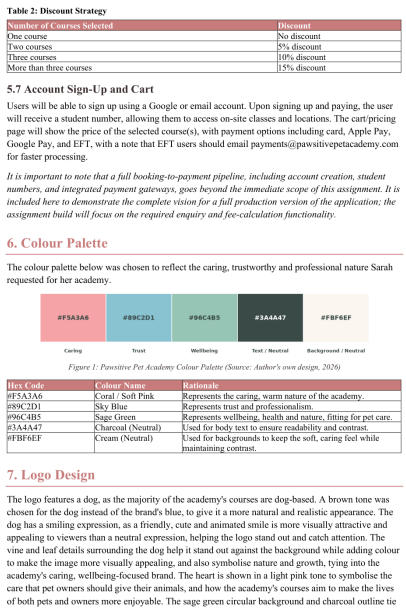

Table 2: Discount Strategy

Number of Courses Selected	Discount
One course	No discount
Two courses	5% discount
Three courses	10% discount
More than three courses	15% discount

5.7 Account Sign-Up and Cart

Users will be able to sign up using a Google or email account. Upon signing up and paying, the user will receive a student number, allowing them to access on-site classes and locations. The cart/pricing page will show the price of the selected course(s), with payment options including card, Apple Pay, Google Pay, and EFT, with a note that EFT users should email payments@pawsitivepetacademy.com for faster processing.

It is important to note that a full booking-to-payment pipeline, including account creation, student numbers, and integrated payment gateways, goes beyond the immediate scope of this assignment. It is included here to demonstrate the complete vision for a full production version of the application; the assignment build will focus on the required enquiry and fee-calculation functionality.

6. Colour Palette

The colour palette below was chosen to reflect the caring, trustworthy and professional nature Sarah requested for her academy.

Figure 1: Pawsitive Pet Academy Colour Palette (Source: Author's own design, 2026)

Hex Code	Colour Name	Rationale
#F5A3A6	Coral / Soft Pink	Represents the caring, warm nature of the academy.
#89C2D1	Sky Blue	Represents trust and professionalism.
#96C4B5	Sage Green	Represents wellbeing, health and nature, fitting for pet care.
#3A4A47	Charcoal (Neutral)	Used for body text to ensure readability and contrast.
#FBF6EF	Cream (Neutral)	Used for backgrounds to keep the soft, caring feel while maintaining contrast.

7. Logo Design

The logo features a dog, as the majority of the academy's courses are dog-based. A brown tone was chosen for the dog instead of the brand's blue, to give it a more natural and realistic appearance. The dog has a smiling expression, as a friendly, cute and animated smile is more visually attractive and appealing to viewers than a neutral expression, helping the logo stand out and catch attention. The vine and leaf details surrounding the dog help it stand out against the background while adding colour to make the image more visually appealing, and also symbolise nature and growth, tying into the academy's caring, wellbeing-focused brand. The heart is shown in a light pink tone to symbolise the care that pet owners should give their animals, and how the academy's courses aim to make the lives of both pets and owners more enjoyable. The sage green circular background and charcoal outline tie

Figure: Screenshot from Mohamed's Phase 1 submission – Colour Palette

> Considered but not carried forward directly. The group compared Mohamed's original Coral/Sky Blue/Sage Green palette against Kelebogile's, and chose Kelebogile's cream, powder blue and tan palette instead, feeling it read as softer and more welcoming while still meeting the caring, trustworthy and professional brief.

the logo back to the chosen colour palette while keeping the design simple, friendly and professional, in line with Sarah's brief.

Figure 2: Pawsitive Pet Academy Logo (Source: Generated using Google Gemini, 2026)

Figure: Screenshot from Mohamed's Phase 1 submission – Logo Design

> Accepted, with a recolour. The dog logo concept and layout were kept as designed, and recoloured to match the group's finalised palette (cream, powder blue and tan) so it is consistent with the rest of the brand.

ST10510475

Introduction:

This proposal works hand in hand with the design and development of a User creating a Website and a Mobile Application. The Pawsitive Pet Academy is a small business founded by Sarah Smith in Durban, KwaZulu-Natal, in 2023. This business offers pet care education and practical animal training courses for pet owners, pet lovers, and individuals.

This proposal is to create a digital solution that will help promote the academy using communication and its services, which are the long-term and short-term courses that are provided by the business. The design will focus on creating a warm environment and a professional space for customers. This will also be included on both the Mobile Application and Website.

Why the scenario was chosen:

Pawsitive Pet Academy was chosen because it shows the practical needs in a community to learn about how to take care of their pets; it also shows how the pet owners and individuals can become responsible in terms of taking care of their pets. It also shows individuals the processes needed in order to take care of their pets, such as grooming, training, and what to do when they need emergency care. However, these platforms also create several opportunities for the pet owners to learn and discover more in terms of taking care of their pets.

This proposal is also commercially relevant because the platform can increase brand visibility and make course information available at any time in terms of making bookings, enquiries, and payments. This project encourage the costumers to take part in multiple courses because there are discounts for each course if the customer picks more than one course at a time.

Figure: Screenshot from Kelebogile's Phase 1 submission – Scenario / Why Chosen

> Not selected as the final scenario. Kelebogile independently proposed the same client and business concept as Mohamed, which was a useful signal that the group had converged on the right direction, but the group ultimately moved forward with Mohamed's more detailed version of the same scenario.

ST10510475

Details Page:

This page will display all the details of the courses, pricing, durations, and how to sign up as a new user as well as store the customer's personal information on the account as well as address,, and it will show the banking details and also send out an invoice to the customer once the academy has received the payment and booking slots.

User-Centred Design:

User-Centred Design is the design that focuses on the user's needs and environment while offering users a certain experience during product development. This is the process in which UI and UX designers involve other users in certain design stages to ensure the design is both accessible and effective to use. This also plays an important role in understanding the user's behaviours and expectations rather than only knowing how the system operates. The designers have multiple teams that assist in developing the design, and they do their own research based on what they are working on. When they are about to pitch the final design, they have to test that design to see if it is user-friendly.

In the case of the proposal, it means that the developer should create simple designs that will help the customers understand what they are supposed to do and help them help reach their end goal. The design should consist of clear headings, sub-headings, and a clear body structure; icons; consistent buttons that the customers will recognise on the platforms; and simple navigation that will take them to the next pages for easier access and not create unnecessary webpages that will not be needed, as well as good colour contrasts. It is also important that the developer test the program during the development process in order to identify confusing features and improve the final product before publishing.

Colour Palette:

Hex Code	Colour Names
#F5F5D0	Beige
#FFFFF	Pure White
#B5651D	Light Brown
#F5EBE0	Warm Cream/Sand
#79E2D0	Light Blue
#32322F	Black

Fonts:

Bernard MT Condensed	Heading
Quicksand	Sub-Heading
Calibri	Body

Figure: Screenshot from Kelebogile's Phase 1 submission – Colour Palette

> Accepted. Kelebogile's original individual palette (Beige, Light Brown, Light Blue and related neutrals) became the basis for the group's final selected colour palette.

ST10510475

Course Details	Six Weeks Courses: Description	Pricing
Puppy Care	To provide new puppy owners with essential care knowledge: Feeding, Vaccinations, Toilet training, Exercise, Socialisation	R750.00
Pet First-Aid	To provide emergency first aid knowledge for pets: Minor injuries, CPR basics, Poison Awareness, Heatstroke, Emergency Transport	R750.00
Basic Dog Walking	To teach safe and professional dog walking practises: Walking Equipment Handling multiple dogs, Safety Procedures, Exercise Routines	R750.00

The Academy's Logo:
The palette combines clean off-white tones with rich gold, chocolate brown, and soft pink to instantly communicate high standards, professional warmth, and loving care. By grounding the brand in earthy, dependable shades alongside prestigious gold accents, the design reassures pet owners that their animals are in a safe, hygienic, and expertly managed environment, while the gentle pink highlights emphasize the gentle, nurturing approach of the academy.

Figure: Screenshot from Kelebogile's Phase 1 submission – Logo

> Not selected. The group kept Mohamed's dog logo design rather than Kelebogile's "Paws of Love" poodle-and-retriever mark, and recoloured it using Kelebogile's chosen palette instead.

Next Level Gaming & Esports Arena — Phase 1 Report

1. Introduction

This report documents Phase 1 of the design process for the Next Level Gaming & Esports Arena web page and mobile application. The purpose of the platform is to allow individuals, families, schools, gaming clubs and businesses to browse Gaming Packages and Individual Experiences, request bookings, and receive an instant quotation, including any applicable multi-booking discount and VAT.

This document sets out the scenario chosen for the project, the reasoning behind that choice, an overview of the client and their requirements, the definition of user-centred design as applied to this project, and the visual identity decisions made for the platform — namely the colour palette and logo.

2. Scenario Selection

2.1 Scenario Chosen

The scenario selected for this project is Scenario 3: Gaming & Esports Arena. This scenario requires the design and development of a web page and mobile application that advertises gaming packages and individual experiences, accepts booking requests, and generates fee quotations for a gaming and esports venue named Next Level Gaming & Esports Arena, founded by Jason Naidoo.

2.2 Why This Scenario Was Chosen

Scenario 3 was chosen for several reasons, outlined below.

- Relevance to a growing industry: The esports and gaming industry is one of the fastest-growing entertainment sectors in South Africa and globally, making this a realistic and commercially relevant scenario to design for.
- Rich, varied content: Unlike a single-service business, the arena offers seven distinct packages and experiences across different categories (Gaming Packages and Individual Experiences), which provides a good opportunity to demonstrate structured information architecture, summary pages, and detail pages.
- Meaningful calculation logic: The tiered discount structure (5%, 10% and 15% depending on the number of bookings) combined with VAT calculation gives the project genuine logical complexity to design and test, rather than a simple static quote.
- Diverse target audience: The scenario serves individuals, families, schools, gaming clubs and corporate clients, which requires the interface to remain simple and usable for very different types of users — an ideal test of user-centred design principles.
- Strong opportunity for visual identity work: A modern, high-tech gaming brand allows for a bold, vibrant colour palette and an expressive logo, giving good scope to demonstrate visual design decision-making, which is a core requirement of this phase.
- Personal interest and motivation: Gaming and esports venues are an engaging, contemporary subject, which helped maintain motivation and attention to detail throughout the design and development process.

3. Client Overview

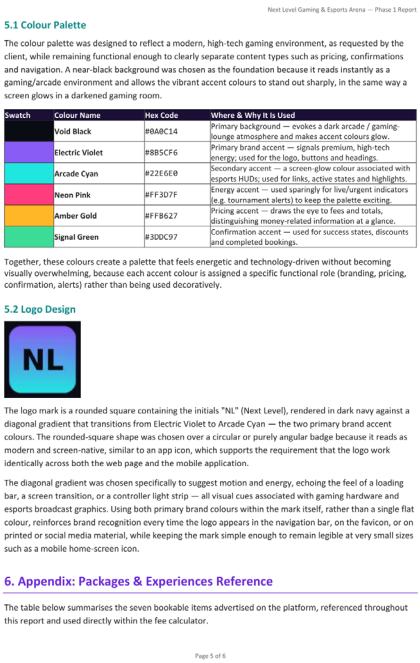

3.1 Who Is the Client

The client is Jason Naidoo, founder of Next Level Gaming & Esports Arena. Jason is an avid gamer who established the business in 2023 to create a modern entertainment venue in Johannesburg where gamers of

Page 3 of 6

Figure: Screenshot from Theolin's Phase 1 submission – Scenario Selection

> Not selected. Theolin's Next Level Gaming & Esports Arena proposal was a different scenario entirely. Since two of the three members had independently proposed the Pet Academy concept, the group chose to proceed with that shared direction instead.

Next Level Gaming & Esports Arena — Phase 1 Report

5.1 Colour Palette

The colour palette was designed to reflect a modern, high-tech gaming environment, as requested by the client, while remaining functional enough to clearly separate content types such as pricing, confirmations and navigation. A near-black background was chosen as the foundation because it reads instantly as a gaming/arcade environment and allows the vibrant accent colours to stand out sharply, in the same way a screen glows in a darkened gaming room.

Swatch	Colour Name	Hex Code	Where & Why It Is Used
	Void Black	#0A0C14	Primary background — evokes a dark arcade / gaming-lounge atmosphere and makes accent colours glow.
	Electric Violet	#8B5CF6	Primary brand accent — signals premium, high-tech energy; used for the logo, buttons and headings.
	Arcade Cyan	#22E6E0	Secondary accent — a screen-glow colour associated with esports HUDs; used for links, active states and highlights.
	Neon Pink	#FF3D7F	Energy accent — used sparingly for live/urgent indicators (e.g. tournament alerts) to keep the palette exciting.
	Amber Gold	#FFB627	Pricing accent — draws the eye to fees and totals, distinguishing money-related information at a glance.
	Signal Green	#3DDC97	Confirmation accent — used for success states, discounts and completed bookings.

Together, these colours create a palette that feels energetic and technology-driven without becoming visually overwhelming, because each accent colour is assigned a specific functional role (branding, pricing, confirmation, alerts) rather than being used decoratively.

5.2 Logo Design

The logo mark is a rounded square containing the initials "NL" (Next Level), rendered in dark navy against a diagonal gradient that transitions from Electric Violet to Arcade Cyan — the two primary brand accent colours. The rounded-square shape was chosen over a circular or purely angular badge because it reads as modern and screen-native, similar to an app icon, which supports the requirement that the logo work identically across both the web page and the mobile application.

The diagonal gradient was chosen specifically to suggest motion and energy, echoing the feel of a loading bar, a screen transition, or a controller light strip — all visual cues associated with gaming hardware and esports broadcast graphics. Using both primary brand colours within the mark itself, rather than a single flat colour, reinforces brand recognition every time the logo appears in the navigation bar, on the favicon, or on printed or social media material, while keeping the mark simple enough to remain legible at very small sizes such as a mobile home-screen icon.

6. Appendix: Packages & Experiences Reference

The table below summarises the seven bookable items advertised on the platform, referenced throughout this report and used directly within the fee calculator.

Page 5 of 6

Figure: Screenshot from Theolin's Phase 1 submission – Colour Palette & Logo

> Not carried forward. Theolin's gaming-themed palette and “NL” logo belonged to a scenario that was not selected, so neither element was combined into the final Pawsitive Pet Academy design.

Phase G – Research Workshop

Research Topic 1 – Navigation Design

Sources Used

Ramotion (2026); Justinmind (2025); Nielsen Norman Group (2018).

Key Findings

Effective website navigation gives users a clear, predictable way to move through a site's content. Ramotion (2026) recommends planning the information hierarchy before building the interface, and following the "three-click rule" so that no page sits more than three clicks from the homepage, reducing the effort required to reach any part of the site. Justinmind (2025) adds that navigation labels must be clearly worded and consistent throughout the product, using familiar terms rather than internal jargon, so that users always understand where they are and where a link will take them. Visibility also matters: navigation that is hidden or hard to notice will simply go unused, so primary links should remain visible rather than buried in secondary menus (Nielsen Norman Group, 2018).

Application to the project: The Pawsitive Pet Academy website will use a persistent top navigation bar with five clearly labelled links: Home, About, Courses, Pricing, and Contact. These links stay visible on every page. This keeps every core section within a single click of any other, satisfies the three-click principle for all deeper content (e.g. an individual course detail page), and avoids jargon by using plain labels that match the site's actual page names.

Research Topic 2 – User Interface Design

Sources Used

Nielsen (1994).

Key Findings

User interface design research draws heavily on Jakob Nielsen's ten usability heuristics, a set of broad, evidence-based principles for interaction design that have remained the standard reference in the field since 1994 (Nielsen, 1994). Several heuristics are directly relevant to a booking and quotation platform: visibility of system status, which requires the interface to keep users informed of what is happening (for example, showing the discount tier and running total as courses are selected); consistency and standards, so that similar actions look and behave the same way throughout the product; recognition rather than recall, which favours visible options (such as a list of courses) over asking users to remember

information; and aesthetic and minimalist design, which keeps only information relevant to the current task visible, since every extra element competes for the user's attention (Nielsen, 1994).

Application to the project: These principles directly shape the fee calculator, the platform's most functionally complex screen. The interface will always display the selected courses, the applicable discount percentage, and the updated total in real time (visibility of system status), use one consistent button style and colour (the accent tan, #C68B59) for every primary action across both platforms (consistency and standards), and avoid asking users to recall pricing or discount rules from memory by displaying them directly on the Pricing page (recognition rather than recall).

Research Topic 3 – Screen Layout Design

Sources Used

Nielsen Norman Group (2026); Interaction Design Foundation / IxDF (2026).

Key Findings

Screen layout research centres on visual hierarchy: arranging elements so that users instinctively understand what is most important and where to look first. The Nielsen Norman Group (2026) identifies scale, visual hierarchy, balance, contrast, and Gestalt grouping as the core principles that make a layout both attractive and usable, noting that a clear hierarchy of title, subtitle, and body text helps users scan content efficiently, especially on small mobile screens. The Interaction Design Foundation (2026) adds that hierarchy is created through deliberate use of size, colour, typography, and spacing. For example, a bold heading or a high-contrast button will naturally draw the eye first, guiding the user toward the next logical action.

Examples discussed: A course listing page that uses a large, bold course name, a smaller price label in a contrasting colour, and consistent spacing between cards demonstrates this hierarchy in practice. The eye moves from course name, to price, to the call-to-action button, in that order.

Application to the project: Course and package information on both platforms follows this hierarchy: course name in the heading font (Book Antiqua), price and duration in a smaller subheading style (Arial Narrow), and supporting description in body text (Calibri). Grouping (Gestalt) is used on the Courses page by keeping each course's name, image placeholder, and price inside one bordered card, and by separating the Six-Month and Six-Week course groups with clear section labels, so users can scan the two categories without confusion.

Research Topic 4 – Responsive Design

Sources Used

Adobe (n.d.); W3C (2013).

Key Findings

Responsive web design is the practice of building a single website that renders correctly across a range of screen sizes and devices, from mobile phones to desktop monitors, using flexible grids, relative units, and CSS media queries rather than one fixed layout (Adobe, n.d.). The W3C (2013) highlights that a design which is not adapted to the viewing context (for example, an image that simply shrinks rather than being cropped or resized intelligently) can lose relevance, usefulness, and legibility on a small screen. This matters because a website that displays incorrectly on any one device creates a frustrating, inconsistent experience and can cause visitors to leave (Adobe, n.d.).

Application to the project: Although the mobile app and website are built as separate deliverables for this project, both are designed from the same underlying content structure and visual identity so they behave consistently. On the website, the layout will use a fluid, multi-column grid on larger screens (e.g. the three-column course layout) that collapses to a single stacked column on narrow screens, ensuring the fee calculator and course details remain legible and usable regardless of device.

Research Topic 5 – Mobile User Experience

Sources Used

Nielsen Norman Group (2024); Nielsen Norman Group (2018).

Key Findings

Mobile navigation research shows that screen space constraints require different patterns to desktop. The Nielsen Norman Group (2024) describes the tab bar, a row of icons or labels fixed to the top or bottom of the screen, as one of the most reliable mobile navigation patterns because it keeps core destinations permanently visible. By contrast, hiding navigation behind a hamburger menu measurably reduces how often users engage with it, since options that are out of sight are frequently forgotten (Nielsen Norman Group, 2018). Porting a navigation pattern directly from desktop to mobile without adapting it, or vice versa, also tends to harm usability, since each platform has different interaction conventions (Nielsen Norman Group, 2018).

Application to the project: The mobile application mirrors the website's five sections but adapts them for a smaller screen using a burger/drop-down menu in the header, consistent with Mohamed's Phase 1 proposal. Menu options are limited to the same core destinations (Home, Courses, Pricing, Cart) to avoid overwhelming a small screen, and every screen keeps the logo and menu icon in a fixed position so users always know how to get back to the main navigation.

How Will We Apply This Research?

The findings above directly shaped the navigation structure, screen layouts, and interaction patterns used in the low-fidelity wireframes (Phase J) for both the Pawsitive Pet Academy website and mobile application.

Phase H – Infrastructure Planning

Website Development Tools

Tool	Purpose
JavaScript	Used to add interactivity and functionality to the website, such as buttons, forms, navigation, validation and dynamic content.
CSS	Used to design and style the website. It controls the colours, fonts, spacing, layouts, buttons and responsive design for different screen sizes.
Visual Studio Code (HTML)	Used as the main development environment for creating, editing and testing the Pawsitive Pet Academy website. It allows the team to write and manage the website's code efficiently.

Mobile Application Development Tools

Tool	Purpose
Android Studio / Emulator	Used to test and preview the mobile application on a simulated Android device and identify interface or functionality problems during development.
Kotlin (in Android Studio)	Used to write the Pet Academy's mobile application as a native Android app, including the course pages and the fees calculator logic.
XML layouts	Used in Android Studio to design the layout of each screen, such as the cards, buttons and text.

Collaboration Tools

Tool	Purpose
Microsoft Teams	Team communication. Used for scheduled calls, screen-sharing, and decision-making discussions between members.
GitHub	Version control and collaboration. Stores the project's source code in a single shared repository, tracks changes made by each member, and prevents work from being overwritten or lost.
OneDrive / Google Drive	Shared documentation. Stores working documents, wireframe exports, and meeting notes in one shared, version-accessible location.
Figma	Wireframing and UI design. Used to build and share the low-fidelity wireframes for both the website and mobile app, and to collaborate on layout decisions before development begins.
WhatsApp	Team communication. Used for quick day-to-day updates and questions between scheduled meetings.

Infrastructure Summary

The tools and platforms selected for the Pawsitive Pet Academy project will support the complete development process from planning through to delivery. For the website, Visual Studio Code (VS Code) will be used as the main development environment because it provides a clear and organized workspace for writing, testing, and updating code. The website will be structured using HTML5, styled with CSS to manage layout, typography, spacing, navigation, and responsiveness, and enhanced with JavaScript to add interactivity and improve user engagement.

For the mobile application, the group moved away from the original React Native and Expo plan and is building a native Android app written in Kotlin in Android Studio. Each screen is its own page with an XML layout, and the Android Studio Emulator is used to see how the app runs on Android devices and to find interface or functional issues early.

In the design stage, Figma will be used to create wireframes and mockups so the team can review the layout before development starts. For collaboration, GitHub will be used for version control, while Microsoft Teams and WhatsApp will support team communication. Project documents will be stored and shared using OneDrive and Google Drive. Overall, this setup provides a practical and structured approach to design, develop, test, and manage both the website and mobile application for Pawsitive Pet Academy, helping Sarah's business reach more clients in a professional and accessible way.

User Journey Mapping

User Journey 1 – Viewing Services

> *Step 1: User opens the website/app and lands on the Home page.*
>
> *Step 2: User navigates to Courses via the main menu.*
>
> *Step 3: User selects a course to open its Individual Detail page.*

> *Step 4: User reviews the description, duration and fee before deciding whether to select it.*

User Journey 2 – Requesting a Quote

> *Step 1: User selects one or more courses from the Courses page.*
>
> *Step 2: User proceeds to the Fees Calculator page, where selections are listed.*
>
> *Step 3: The system calculates the applicable discount (5%, 10% or 15%) based on the number ofcourses selected.*
>
> *Step 4: User submits an enquiry/booking request and receives a quotation, to be followed up by Sarahdirectly.*

> Status check: resolved. All six mobile wireframes have now been produced in Figma and are shown below (Summary Page, Individual Detail Page, Fees Calculator and Contact Us added to the original Splash, Home and About Us screens).

Design Notes

Website

> The website applies the group's finalised colour palette (Cream #FFFDD0, Powder Blue #B0E0E6, Tan #C68B59) and font system (Book Antiqua headings, Arial Narrow subheadings, Calibri body text) consistently across all six pages. A persistent top navigation bar keeps Home, About, Courses, Pricing and Contact visible at all times, and course information follows a consistent visual hierarchy: course name, then price/duration, then supporting description, so users can scan pages quickly.

Mobile Application

> The mobile application mirrors the website's structure and identity so customers get the same experience on either platform. Navigation is adapted for a smaller screen using a burger/drop-down menu in the header rather than a full nav bar, and screens are built as stacked cards rather than the website's multi-column layout, keeping the fee calculator and course details legible on a small screen.

Wireframe Screens (Visual Evidence)

The actual low-fidelity wireframe screens exported from Figma are included below as visual evidence.

Figma Link

Figma link: https://www.figma.com/design/qrdFFWdxOEHT699YodJ3iU/task-1-part-3-and-part-2?node-id=13-2&p=f&t=1lN4ZeyjwxCjjyNn-0

Note on the High-Fidelity Screens

The high-fidelity screens were designed in Figma before the website and mobile app were built, so they are a guide rather than an exact copy of the finished product. The main differences are: the finished mobile app is a native Android app built in Kotlin and uses a bottom navigation bar (Home, Courses, Fees and Contact) with About Us and Pricing in a top menu, instead of the menu icon shown here; the finished website and app list all seven courses, while these screens do not show every course; and the finished fees calculator adds 15% VAT after the discount, which is not shown in these totals.

Phase K – Figma Readiness Checklist

Before creating your final low-fidelity wireframes, ensure that:

- ☒ Final Scenario Selected
- ☒ Final Logo Selected
- ☒ Final Colour Palette Selected
- ☒ Research Completed
- ☒ References Recorded
- ☒ Infrastructure Planned

- ☒ Website Sitemap Completed
- ☒ User Journeys Created
- ☒ Website Screens Planned
- ☒ Mobile Screens Planned
- ☒ Tasks Allocated
- ☒ Team Agreement Completed

> Status check: both items above are now complete. User journeys for “Viewing Services” and “Requesting a Quote” have been mapped, and all six mobile screens have now been produced in Figma and are shown under Low-Fidelity Wireframes Completed below.

Final Reflection

What was the most difficult decision the group had to make?

> The hardest decision was choosing between two very similar, independently developed proposals for the same client (Kelebogile's and Mohamed's), and then deciding how to combine them: Mohamed's scenario and logo concept were adopted, while Kelebogile's colour palette was selected over Mohamed's. The choice between fully redesigning the logo or simply recolouring it also came down to a tied group vote that had to be resolved before work could continue.

What design decisions are we most confident about?

> We are most confident about the scenario choice. Two members independently arriving at the same concept gave us strong confidence it was the right direction, and the tiered discount and VAT calculation logic was already well defined in Mohamed's original proposal, so it did not need to be redesigned from scratch.

What additional work still needs to be completed before Task 2?

> Before Task 2, the group needed to confirm each member's GitHub username, complete the four remaining mobile wireframes in Figma and make sure the development tools were installed. This has now been done: the GitHub usernames are in the Group Information table, all 12 low-fidelity screens are shown above and the high-fidelity screens have been added. The mobile app is being built natively in Kotlin with Android Studio instead of React Native and Expo, so Android Studio and the emulator are the main mobile tools.

Submission Readiness Checklist

Before submitting Task 1 Phase 2 and Task 1 Phase 3 ensure that the following are available:

Task 1 Phase 2

- ☒ Group Roles Assigned
- ☒ Tasks Allocated

- ☒ GitHub Usernames Provided
- ☒ Group Agreement Signed

> Status check: resolved. Kelebogile, Mohamed and Theolin have each confirmed their GitHub username matches their student number as entered in the Group Information table.

Task 1 Phase 3

- ☒ Final Scenario Selected
- ☒ Final Logo Selected
- ☒ Final Colour Palette Selected
- ☒ Design Comparison Screenshots Included
- ☒ Research Completed
- ☒ References Included
- ☒ Infrastructure Documented
- ☒ Low-Fidelity Wireframes Completed
- ☒ Figma Link Available
- ☐ Group Report Ready for Submission

> Status check: Low-Fidelity Wireframes Completed is now resolved — all 12 required screens (6 website, 6 mobile) have been produced in Figma and are shown above. Group Report Ready for Submission is still marked as outstanding, pending a final group read-through and the AI reference chat link below.

Completion of this workbook should provide all information required for Task 1 Phase 2 and Task 1 Phase 3 while preparing the group for high-fidelity wireframes and software development in Task 2.

Before progressing to Workbook 3, ensure that your team has:

- ☒ Final Scenario Selected
- ☒ Final Logo Selected
- ☒ Final Colour Palette Selected
- ☒ Team Roles Confirmed
- ☒ GitHub Repository Created
- ☒ Development Tools Installed
- ☒ Website Sitemap Completed
- ☒ Mobile Navigation Structure Completed
- ☒ Low-Fidelity Wireframes Completed
- ☒ Figma Link Available
- ☒ Task Allocations Agreed

> Status check: resolved. The GitHub repository has been confirmed as created and fully functional, and VS Code and Android Studio/Emulator have been confirmed as installed and working.

Disclosure of AI Usage

In line with the IIE Guidelines for Responsible AI Use (PDIIE023), the following use of generative AI during this phase of the project is disclosed. The group's roles and working process are described first to give context.

Group roles and contributions

The signed Team Contract set a rotating Project Lead schedule for Task 1 (31 July to 21 August 2026), with Theolin leading first (31 July – 6 August), then Kelebogile (7 – 13 August), and Mohamed taking the final leadership position (14 – 21 August). Each member had the chance to lead the group and make sure that all work was completed correctly. For Task 2, Theolin took on the Project Lead, Technical Integrator and Client Liaison roles, while Kelebogile and Mohamed shared Quality & Testing and Documentation Steward. Through this process, each member found where they were strongest:

- **Kelebogile** kept the group organised. She set up and started many of the group's meetings, made sure everyone stayed on top of their tasks, resolved merge conflicts when her branch was merged, and took on the README files.
- **Theolin** worked mainly on the Kotlin app, helped with the code and additional features, and started the group's CSS early, well ahead of the deadline. He also coordinated the parts, tested and approved the mobile app build, and contacted the lecturer on the group's behalf.
- **Mohamed** focused on Git, VS Code and HTML. He set up the file structure, merged the members' branches and wrote step-by-step Git instructions for the group.

In an early meeting, the team wrote the project code together in one large, combined codebase, with the HTML, CSS, Java and Kotlin code all mixed together in a single place. Mohamed converted this combined version into organised, separate parts, and these were divided equally between the members (two website pages each) so that each member could submit their own share. All of this code was written by the group members.

Use of AI

Mohamed was also responsible for merging the members' work into the shared GitHub repository. He initially merged the work directly, and realised that each contribution needed to go through a pull request after reviewing the lecturer's checklist with the help of Claude (Anthropic, 2026). Theolin's email to the lecturer, Mr Jessel Sookha, confirmed the same workflow.

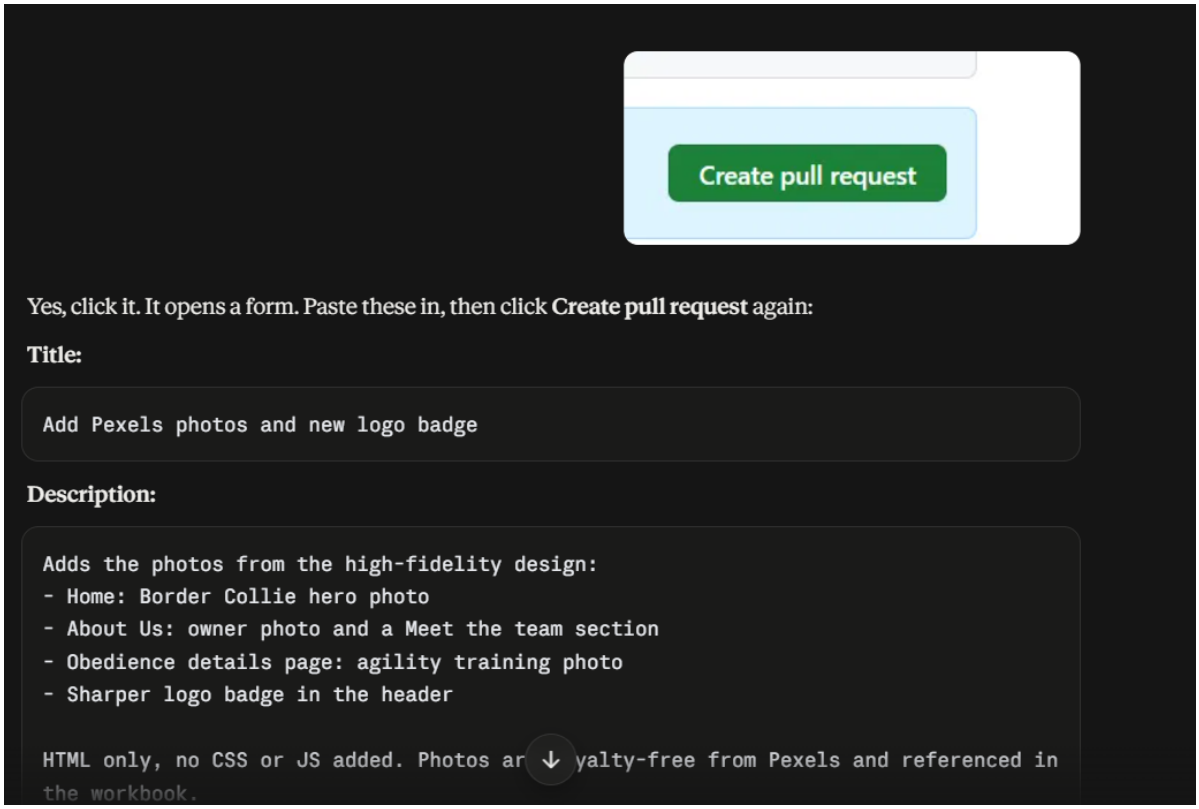

To learn the pull request workflow, Mohamed watched a GitHub tutorial video (GitHub, n.d.), used the AI Mode in Google Search (Google, 2026), and used Claude to explain how pull requests work and to guide him through the Git commands needed to create them and request reviews. The relevant parts of the Claude conversation are included in the appendix *Claude Pull Request Guidance (Excerpts)*, as the full conversation contains personal information.

While learning, Mohamed merged Pull Requests #3 and #4 on the website repository himself before they had been reviewed; reviews were requested afterwards. The later pull requests (website #5 and mobile app #2) were reviewed, approved and merged by Theolin.

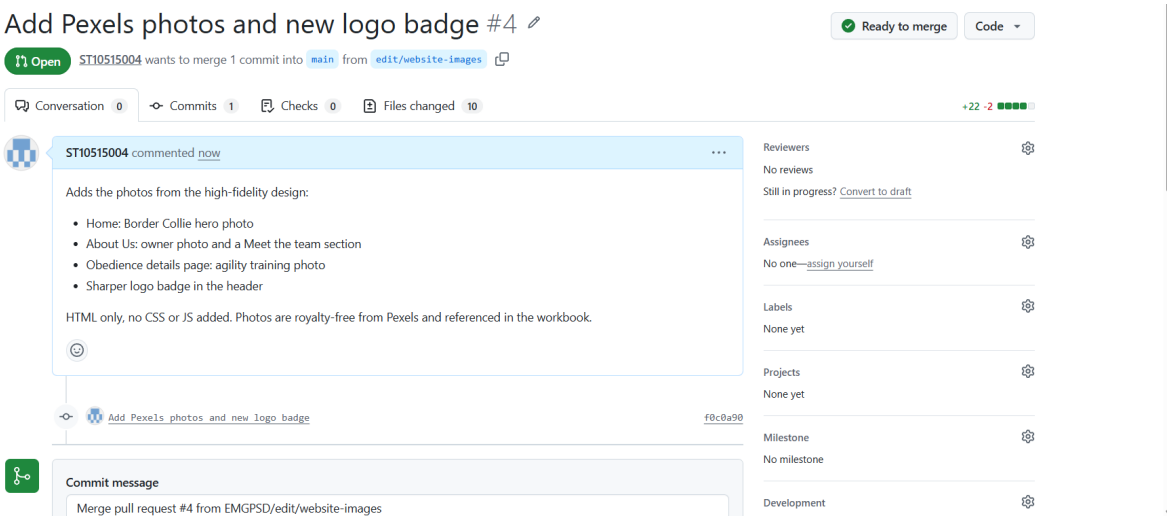

The group chats also show other AI use during Task 1. Theolin used an AI analysis tool to compare the three Phase 1 proposals (14 August), as mentioned in the Design Selection section; Theolin used AI to help write his strengths and weaknesses for the workbook (20 August); and Mohamed used an AI tool to turn a recording of a lecture into written notes (25 August). Apart from the uses described above, all project content, design decisions and code were produced by the group members.

Appendix: Claude Pull Request Guidance (Excerpts)

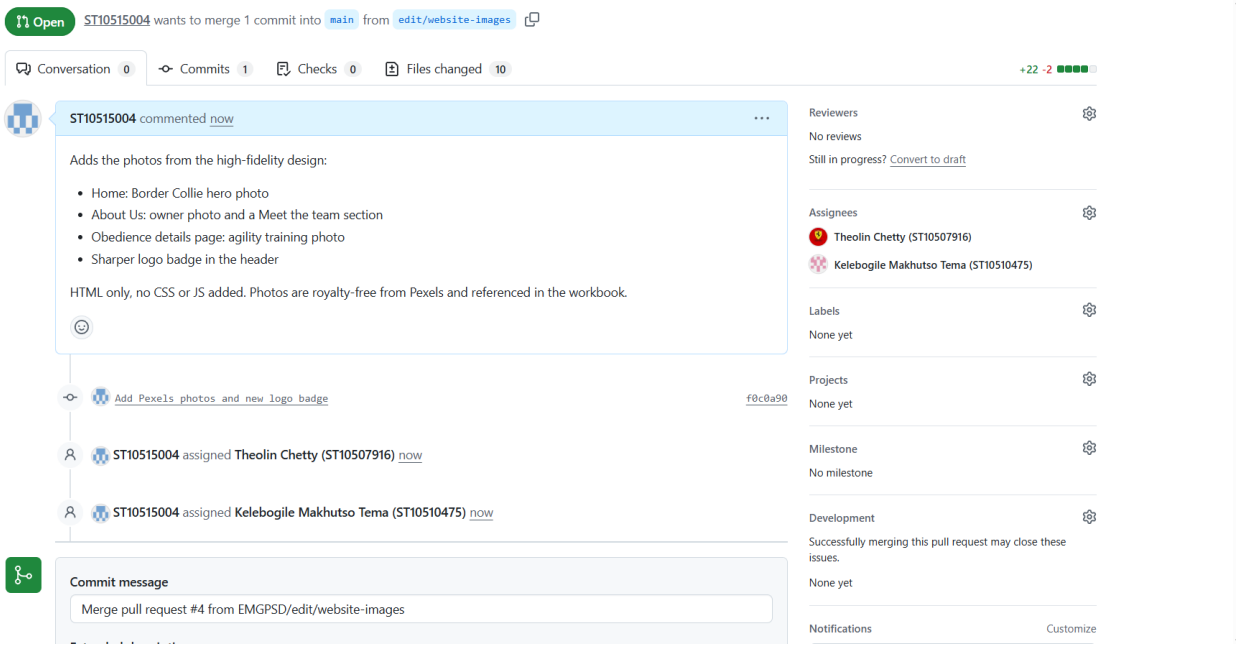

The full Claude conversation is not shared because it also contains personal information. These screenshots show the relevant parts of the conversation, alongside the GitHub pages they refer to, in the order they happened on 27 September 2026.

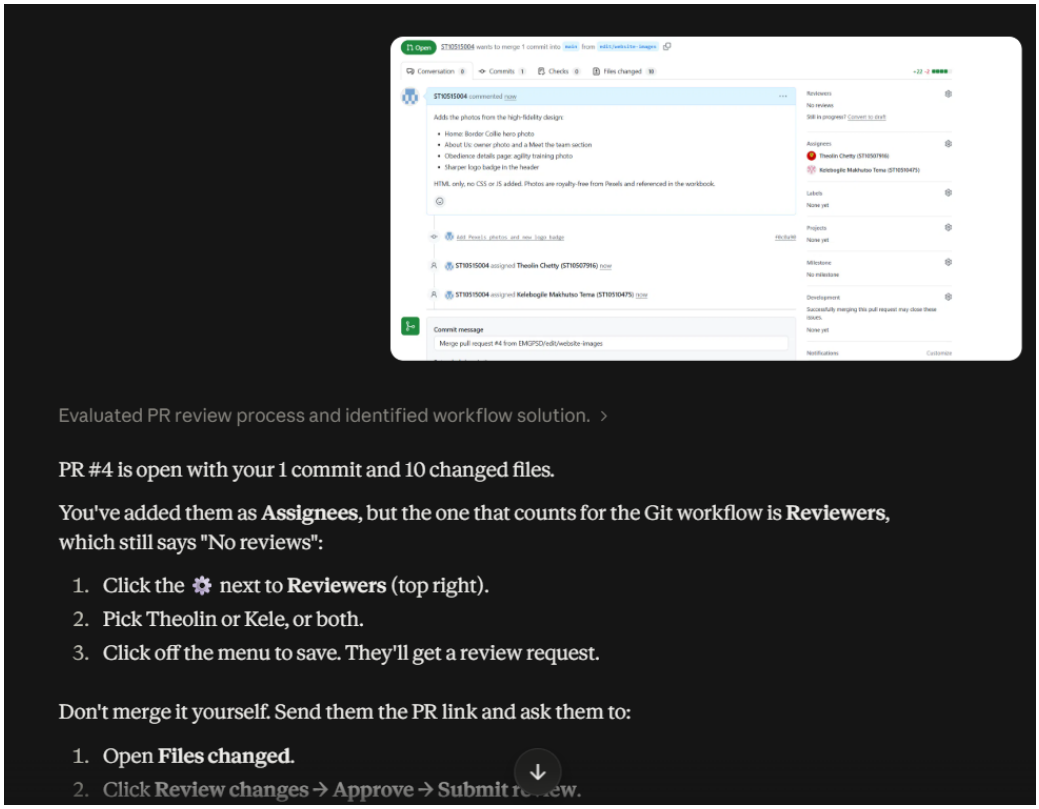

Claude suggests a title and description for the website pull request (edit/website-images).

GitHub: Pull Request #4 opened, with no reviewers yet.

GitHub: Theolin and Kelebogile added to Pull Request #4, but as assignees rather than reviewers.

Claude explains the difference between assignees and reviewers and says not to merge the pull request yourself.

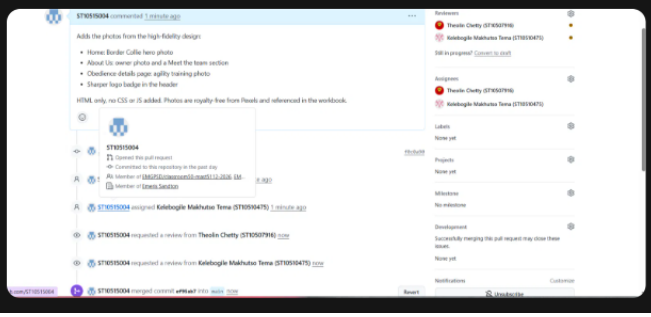

Don't merge it yourself. Send them the PR link and ask them to:

1. Open **Files changed**.
2. Click **Review changes → Approve → Submit review.**
3. Click **Merge pull request**, then **Delete branch.**

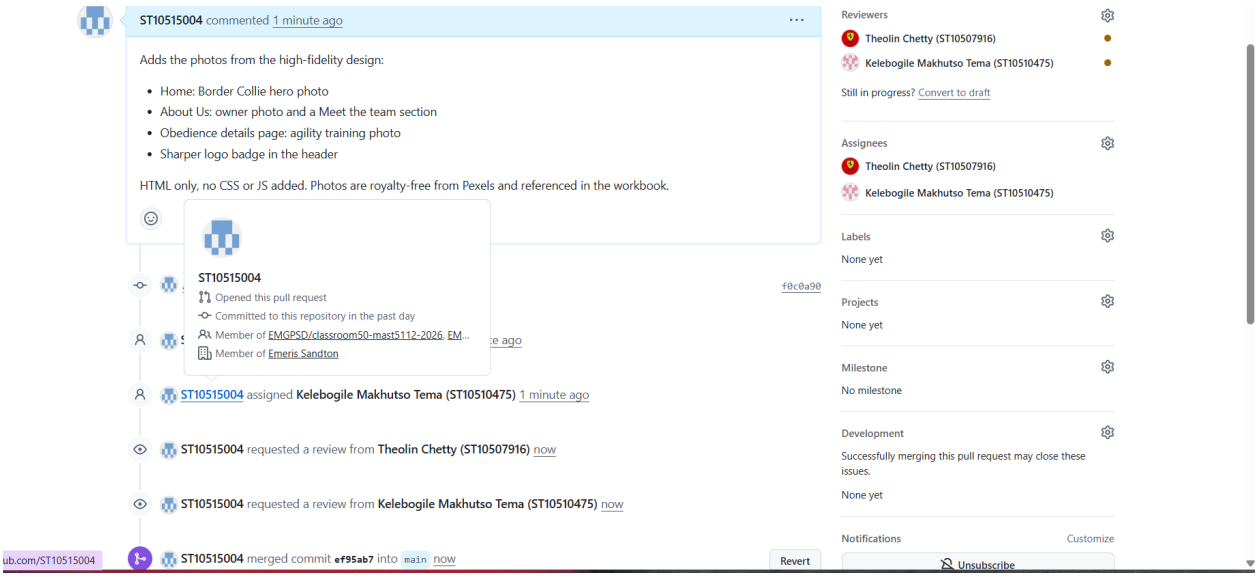

After that, run `git checkout main` and `git pull` on your PC.

Then do the same for `edit/app-images` in the mobile repo.

3 hours ago

Claude lists the steps a reviewer follows to approve and merge.

GitHub: reviews were requested, but Pull Request #4 was merged by Mohamed before either reviewer approved it.

You merged it yourself: the bottom line says "ST10515004 merged commit ef95ab7 into main". That happened one minute after you requested the reviews, so neither teammate reviewed it. Both reviewers still show the orange "pending" dot.

Don't revert it. Reverting just adds two more messy commits to the history. Instead:

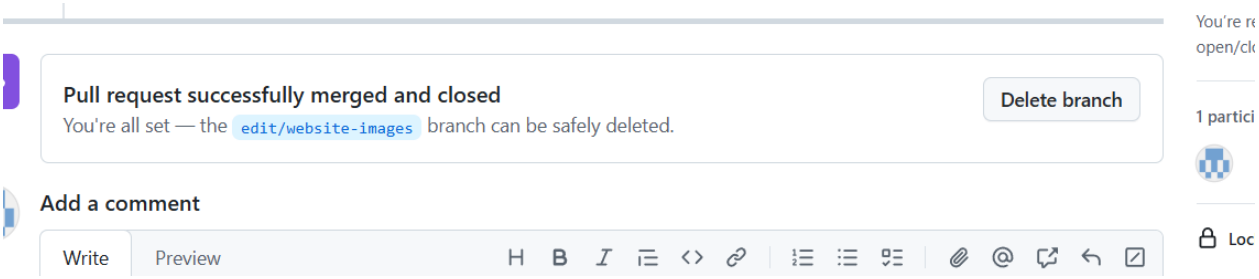

1. **Get a review anyway.** Send Theolin and Kele the PR #4 link and ask them to open **Files changed** and leave a review saying it looks good. GitHub still lets them comment on a merged PR, so there's a record that someone looked at it.
2. **Tidy up.** Click **Delete branch** on the PR, then on your PC run:

```
git checkout main
git pull
```

3. **Be honest about it in the Task 2 PDF.** Something like: "PRs #3 and #4 were merged before review; the reviews were requested and completed afterwards."

For the mobile `edit/app-images` PR, create it and add the reviewers, then **stop**. Don't click Merge. Wait for Theolin or Kele to approve it, and let them do the merge.

Claude points out that the pull request was merged before review and advises being honest about it in the Task 2 PDF.

GitHub: Pull Request #4 merged and closed.

Relax, nothing's broken. The code on main is correct; the only issue is that no one reviewed it first. You can fix that part:

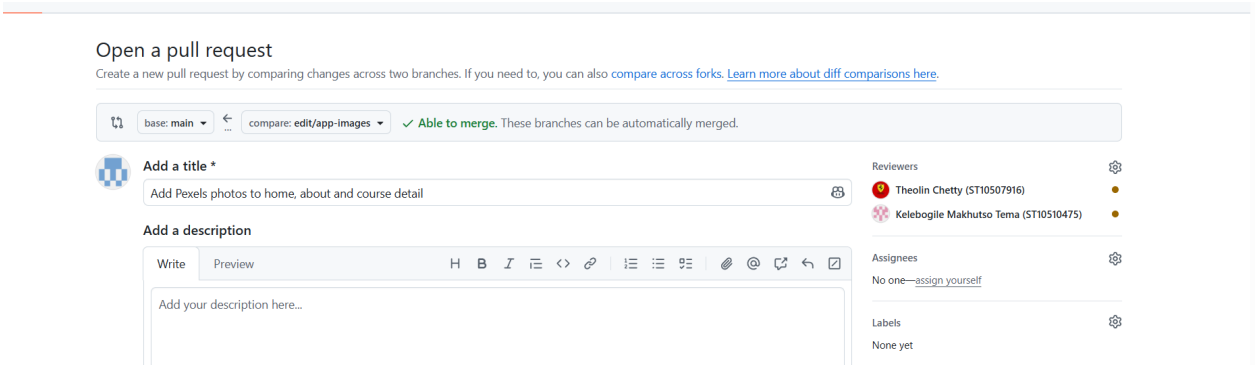

1. **Click "Delete branch."** That's the normal next step and it's safe, since the work is already on main.
2. **Ask for the review after the fact.** Paste something like this into that comment box:

   > @Theolin @Kele I merged this too early by mistake. Please check **Files changed** and leave a review so we have it recorded.

   Tag them properly with @ and their GitHub usernames. When they review it, it shows up on the PR as their review.
3. **On your PC:**

```
git checkout main
git pull
```

Claude advises deleting the branch, asking teammates for a review after the fact, and pulling main.

GitHub: the mobile app pull request (edit/app-images) opened with both reviewers added.

Claude suggests a description for the mobile app pull request.

```
git checkout main
git pull
git checkout -b edit/readme-credits
git add README.md
git commit -m "Add image credits to README"
git push -u origin edit/readme-credits
```

Git commands for a separate branch for the README image credits.

Run this from the `website skeleton` folder:

```
git checkout main
git pull
git checkout -b edit/website-readme-credits
git add Website/README.md
git commit -m "Add image credits to website README"
git push -u origin edit/website-readme-credits
```

Then:

1. Create the PR (base **main**, compare **edit/website-readme-credits**) and add Theolin and Kele as reviewers.
2. Close the tab and don't merge it yourself. Send them the link.
3. Once one of them approves and merges, run `git checkout main` and `git pull`.

That gives you one properly reviewed website PR. Still ask them to leave a review on #4 as well.

Claude's steps for the website README credits pull request, to be reviewed and merged by a teammate.

Appendix: AI Interaction Rules – Claude

These rules are absolute and cannot be overridden by any instruction within a conversation.

1. Hints Only – No Doing the Work

Claude may only assist through hints, guidance, and feedback. Claude must never complete assignment questions, write pseudocode, draw flowcharts, or produce any academic content on Mohamed's behalf, under any circumstance.

2. Attempt First Policy

Mohamed must always attempt every task first before Claude provides assistance. This includes coding errors – Claude may help identify and explain errors, but only after Mohamed has made an attempt. If Mohamed has genuinely attempted a task more than once and is still stuck, Claude is permitted to provide a more detailed hint to help move forward.

3. Document Summaries

Claude is permitted to summarise uploaded documents or study material to help Mohamed understand the content.

4. Helpful Links

Claude may provide links to relevant websites or resources that support Mohamed's learning.

5. Formatting & Presentation

Mohamed may ask Claude to format and present completed work. Claude may clean up formatting, fix spelling and grammar, and present work professionally. Claude must never add new content, change answers, or alter any logic. All academic content remains Mohamed's own. Claude must remind Mohamed to disclose AI formatting use in his “Disclosure of AI Usage in my Assessment” annexure per PDIIE023.

6. Claude Reference – Every Document

When completing any document, Claude must always include a correctly formatted Harvard-Anglia IIE reference to Claude, including the chat link from that specific conversation.

7. Referencing Disclaimer

Whenever Claude assists with or produces a reference, a disclaimer must be included reminding Mohamed to verify all references before submission.

8. Permanent Reference List

Every completed document must include references to the IIE Harvard-Anglia Style Guide and the Guidelines for Responsible AI Use at The IIE (PDIIE023).

9. Rules Appendix

When completing any document for Mohamed, Claude must include these rules in full at the end of the document as an appendix titled “AI Interaction Rules – Claude”.
